## MOLECULAR BIOLOGY

### SARS COV -2 REAL TIME PCR

SARS-COV-2 RNA

NEGATIVE

#### Comments

SAMPLE TYPE :-nasopharyngeal swab & oropharyngeal swab

References: Laboratory testing for Corona Virus Disease 2019(COVID-19) in suspected human cases,WHO interim guidelines 2nd March 2020.  
CT value : >32 but < 35 are borderline cases, same should be tested on a fresh sample after 3 to 4 days if clinically indicated.

Disclaimer : There are no reliable studies to definitively prove a direct correlation between disease severity/ infectiousness and Ct values, therefore it is not recommended to rely on

numerical Ct values for determining infectiousness of COVID-19 patients and deciding patient management protocols.

Note:

1.ICMR Registration number for COVID 19 is SRLWBK

2.Negative result does not rule out the possibility of Covid 19 infection.Presence of inhibitors,mutations and insufficient RNA specific to SARS-CoV-2 can influence the test result .Kindly correlate the result with clinical findings.

3.Covid -19 Test conducted as per kits approved by ICMR/USFDA.

4.Kindly consult referring Physician / Authorized Govt.hospital for appropriate follow up.

In case of COVID-19 Positive Report -

Please contact for any information to:

#### Interpretation(s)

SARS COV -2 REAL TIME PCR-SARS-CoV-2, formerly known as 2019-nCoV, is the causative agent of the coronavirus disease 2019 (COVID-19). Main symptoms of the disease include fever, cough and shortness of breath. SARS-CoV-2 transmission occurs primarily via respiratory droplets. SARS-CoV-2 is likely to be at the highest concentrations in the nasopharynx during the first 3 to 5 days of symptomatic illness. Real Time PCR assay targets specific genes and can be used for diagnosis of SARS-CoV-2 virus infection.

Positive result indicates that RNA from SARS-CoV-2 was detected in the specimen, and the patient is considered infected with the virus and presumed to be contagious. Negative test result for this test means that SARS-CoV-2 RNA was not detected in the specimen

Limitations:

- Negative results do not preclude COVID-19 and must be correlated with clinical observations, patient history, and epidemiological information.
- Positive results do not rule out bacterial infection or co-infection with other viruses.
- The sensitivity of the assay is dependent on the timing of the specimen collection (in relation to symptom onset/stage of infection), quality, and type of the specimen submitted for testing
- Follow-up testing may particularly be important if patient has a clinical picture of viral pneumonia, a potential exposure history, and/or radiographic findings (chest CT or MRI scan) consistent with COVID -19 pneumonia. However repeat testing in the near-term after clearance (within 90 days) should be avoided as prolonged shedding of non-viable virus is not uncommon
- Ct values generated from different assay systems within the same laboratory, or from different laboratories, are not directly comparable and do not necessarily reflect the same viral load due to inter-assay and inter-laboratory variability.
- Variation in timing of sample collection, fluctuations in virus shedding, and difference between detection limit of different testing methods within same or different labs could lead to variation in results particularly during initial phase of infection.
- If the virus mutates in the rRT-PCR target region, 2019-nCoV may not be detected or may be detected less predictably. Inhibitors or other types of interference may produce a false negative result.
- The performance of this test has not been established for monitoring treatment of 2019-nCoV infection.

## CONDITIONS OF LABORATORY TESTING & REPORTING

1. It is presumed that the test sample belongs to the patient named or identified in the test requisition form.
2. All Tests are performed and reported as per the turnaround time stated in the SRL Directory of services (DOS).
3. SRL confirms that all tests have been performed or assayed with highest quality standards, clinical safety & technical integrity.
4. A requested test might not be performed if:
  - a. Specimen received is insufficient or inappropriate
  - b. Specimen quality is unsatisfactory
  - c. Incorrect specimen type
  - d. Request for testing is withdrawn by the ordering doctor or patient
  - e. There is a discrepancy between the label on the specimen container and the name on the test requisition form
5. The results of a laboratory test are dependent on the quality of the sample as well as the assay technology.
6. Result delays could be because of uncontrolled circumstances. e.g. assay run failure.
7. Tests parameters marked by asterisks are excluded from the "scope" of NABL accredited tests. (If laboratory is accredited).
8. Laboratory results should be correlated with clinical information to determine Final diagnosis.
9. Test results are not valid for Medico- legal purposes.
10. In case of queries or unexpected test results please call at SRL customer care (91115 91115). Post proper investigation repeat analysis may be carried out.
